The Brenta Group or Brenta Dolomites (Italian: Dolomiti di Brenta) is a mountain range, and a subrange of the Rhaetian Alps in the Southern Limestone Alps mountain group. They are located in the Province of Trentino, in northeastern Italy. It is the only dolomitic group west of river Adige. Therefore, geographically, they have not always been considered a part of the Dolomites mountain ranges.

25 of the sexiest Italian hotel suites From a clifftop perch with views of Capri to a restored palazzo in Verona or lofty Dolomites retreat, Sue Bryant picks the most seductive places to stay

Definitive cultural guide to monuments, museums and architectural and archological sites. Each book in the

Heritage Guide series provides: dozens of full-color maps; color photographs and line drawings accompanying detailed and up-to-date text; travelers' information with selected addresses of museums, galleries, theaters, cultural institutions, stores for fine shopping, cafes and pastry shops; listings of accommodations and restaurants with quality ratings, price range, addresses and telephone and fax numbers. Special features in *The Heritage Guide to Italy*: detachable fold-out map of the entire country; 120 maps and plans of cities and historical sites; 80 driving tours with detailed maps; nearly 1000 descriptions of cities, towns, villages and landmarks.

Presents information on travel, restaurants, accommodations, sightseeing, and shopping for Italy-bound tourists

This volume contains a collection of papers presented as distinguished guest lectures at the International Conference on "The Origin of Arcs" held at the University of Urbino in September 1986, under the joint sponsorship of the European Union of Geosciences and the Italian Geological Society. The workshop on island and mountain arcs has been organized with the aim of increasing our understanding of the intrinsic nature of orogenic and post-orogenic processes, on the basis of empiric factual data, rather than particular theoretic models. Quite often a trivial piece of field data appears to bear much more weight than many fascinating hypotheses put forward by the human mind. This seems to be much more valid in geology, where a special method is necessitated by the particular nature of the geological phenomena and the time concept. Every general law deduced should be rooted in the study of the earth's development in geological time. It is the editor's opinion that there must first be an inductive picture by means of geological methods and then it must be interpreted by geophysicists in the light of physical laws. The geological method must serve, besides, to test the historical credibility of geophysical theories. It is clear that these two methods, the geological-historical one and the geophysical one, must be complementary and the one must not substitute the other. Since the problem of the structure and origin of arcs is open to several solutions, different factors being still unexplained, all correctly deduced opinions are considered by the editor. The contributors to this pre-conference volume have been asked to present essential geological results, as concrete as possible, on some basic problems, such as: Are the island and mountain arcs primary or induced features? How have these orogenic festoons developed into their similar regular shapes? What are the relationships between "primary" active arcs and "secondary" mountain arcs? What is the dominant deformational factor in the bulging of the arc? What is the real nature and tectonic significance of the Benioff zone? These papers have been grouped into five more or less natural sections, of which three are defined on the basis of geography. But of course several range broadly and the classification serves only to channel the discussion in a practical way.
