Capturing and meeting all the constraints in your PCB design doesn't have to be a manual process. You need the confidence that you're meeting your design rules and achieving your design goals throughout the entire design process, all the way to fabrication. With a constraint-driven design flow, you can easily capture your design rules and visually verify that they're being met in real-time as you design so you can get your designs done faster and with less stress at sign off.

We use constraints as a backstop to avoid anarchy and as a vehicle for design verification. If there are no comparable board files, you have the luxury of starting from scratch and doing it right by design. Only you can make the rules. That already sounds like a good game plan to me.
