(PDF) MODI & VAM Methods | Dalgobind Mahto - Academia.edu The MODI (modified distribution) method allows us to compute improvement indices quickly for each unused square without drawing all of the closed paths. Because of this, it can often provide considerable time savings over other methods for solving

Since there is no negative index computed, it means that using the MODI method, the VAM solution is the optimal solution of the company. The Improvement Indices (Iij) are computed as follows: RA-W2 index = 25 - R1 - K2 = 25 - 0 - 10 = 15 RB-W1 index = 15 - R2 - K1 = 15 - (-2) - 10 = 7 RB-W3 index = 8 - R2 - K3 = 8 - (-2) - 10 = 0 RD-W3 index = 0 - R3 - K3 = 0 - (-10) - 10 = 0

In general, we let The MODI method then requires five steps: 1. To compute the values for each row and column, set $R_i + K_j = C_{ij}$ but only for those squares that are currently used or occupied. For example, if the square at the intersection of row 2 and column 1 is occupied, we set $R_2 + K_1 = C_{21}$. 2. After all equations have been written, set $R_1 = 0$. 3.
